Data Reports

These reports provide a medium for filing and archiving data compilations where little or no analysis is included. Such compilations commonly will have been prepared in support of other journal publications or reports. The subject matter of Data Reports reflects the broad interests and policies of the Fisheries and Marine Service, namely, fisheries management, technology and development, ocean sciences and aquatic environments relevant to Canada.

Numbers 1-25 in this series were issued as Fisheries and Marine Service Data Records by the Pacific Biological Station, Nanaimo, B.C. The series name was changed with report number 26.

Data Reports are not intended for general distribution and the contents must not be referred to in other publications without prior written clearance from the issuing establishment. The correct citation appears above the abstract of each report.

Rapports statistiques

Ces rapports servent de base à la compilation des données de classement et d'archives pour lesquelles il y a peu ou point d'analyse. Cette compilation aura d'ordinaire été préparée pour appuyer d'autres publications ou rapports. Les sujets des Rapports statistiques reflètent la vaste gamme des intérêts et politiques du Service des pêches et de la mer, notamment gestion des pêches, techniques et développement, sciences océaniques et environnements aquatiques, au Canada.

Les numéros 1-25 de cette série ont été publies à titre de Records statistiques, Service des pêches et de la mer, par la Station biologique du Pacifique, Nanaimo (C.-B.). Le nom de la série a été modifie à partir du numero 26.

Les Rapports statistiques ne sont pas préparés pour une vaste distribution et leur contenu ne doit pas être mentionné dans une publication sans autorisation écrite préalable de l'établissement auteur Le titre exact paraît au haut du résumé de chaque rapport.

RÉSUMÉ

Gordon, D. K., M. Kotyk, T. Brown, C. D. Levings, and C.D. McAllaiter. 1983. Data record on coded wire tags recovered from juvenile chinook at Campbell River estuary and Discovery Passage, 1982. Can. Data. Rep. Fish. Aquat. Sci. No. 403: iii + 57 p.

Les données concernent la longueur, le poids et le relevé des étiquettes métalliques codées de saumons chinooks juvéniles capturés à l'aide de sennes de rivage dans l'estuaire de la rivière Campbell et le passage Discovery en 1982. Les échantillons ont été recueillis à 55 endroits de mai à décembre 1982. Le lieu, la date et l'heure de la prise sont précisés.

Mots-clés: saumon chinook, rivière Campbell, estuaire, étiquettes métalliques codées, longueur, poids.

INTRODUCTION

To help evaluate the significance of estuarine habitats to juvenile salmonids, marked hatchery chinook from a 1982 time-and-size at release experiment, at the Quinsam Hatchery in Campbell River, were sampled. The chinook were marked with a coded wire nose tag and had their adipose fin clipped.

The majority of fish were obtained by sub-sampling from a complementary distributional study, with complete tabulations being presented elsewhere (Brown et al. 1983). Some marked chinook (n <50) were taken from a separate distributional study conducted by personnel from the Habitat Management Division, Field Services Branch (HMD/FSB). Most of this group's stations were south of Campbell River, an area not well covered by our sampling pattern. Mr. Kevin Conlin kindly agreed to supply these fish and data from them were incorporated into the present data set.

SAMPLING PROCEDURES

Fish were caught using a 14.7 m beach seine with wings 4.9 m (1 cm stretched mesh), bunt 4.9 m (3 mm stretched mesh), and depth 1.5 m. The net was fitted with 15 m towing lines off the wings. Usually the net was pulled off the beach using a 5 m inflatable boat with a 50 hp outboard engine. The distance the net was taken offshore depended on local conditions such as currents, bottom topography, and floating obstacles (wharves, kelp beds) and therefore ranged from 5 to 15 m.

Catches were usually held in the bunt of the net while being subsampled, however when numbers were too large for this to be feasible they were held in floating cages (75 cm long x 50 cm wide x 37 cm deep ; 3 mm mesh size). The fish were fixed in 10% formalin and, after measuring and weighing, preserved in 50% isopropanol. Tags were removed and read at the DFO Head Recovery Lab, North Vancouver, or by a contract technician working at the West Vancouver Lab.

SAMPLING LOCATIONS

Sampling was conducted at 27 locations within the Campbell River estuary (Fig. 1), and at 28 locations in Discovery Passage (Fig. 2). Descriptions of each of the sampling locations are presented in Table 1. All stations occupied, including those where marked chinook were not recovered, are shown.

DATA PRESENTED

A. Explanation of columns

Data are given, in a left to right sequence, on the following observations for individual chinook (Table 2).

Observation	Comments
Date (year, month, day)	Recoverv data are arranged in chronological order
Stn.	Station number
Time	Time of recovery is indicated in Pacific Standard Time
sp.	Code for species (05); chinook in all cases
#	Indicates the number of fish sampled from a particular beach seine set.
m-code	code which identifies each fish uniquely and used for linking to feeding and aging information. These numbers were assigned during weighing and measuring before coded wire tags were removed and read.
C.W.T.	code wire tag code
length	length in millimetres measured after preservation in 10% formalin for <1 month
weight	weight in grams after damp drying with paper towelling

B. Missing Data Codes

During the processing of the fish, tag removal, and the reading of the coded wire tags there were circumstances where data were lost. These are coded in the following way:

- 7 indicates fish misplaced after length and weight obtained.
- 8 indicates pin lost after extraction
- 9 indicates no pin found in fish
- 1 indicates missing data, attributable to the following situations: (1) where fish were not adequately fixed in formalin and hence accurate weights could not be obtained; (2) some fish were sent to Dr. A. McCarter, Dept. of Chemistry, University of Victoria, for analyses of metallothioneins. The fish had to be quick frozen in liquid nitrogen and after this treatment were generally unsuitable for length and weight determinations; (3) some sample containers failed to receive labels in the field and hence their location, date, and time of recapture could not be identified. Appendix 1 lists the lengths, weights, and CWTs of these fish.

ACKNOWLEDGMENTS

Thanks due to Leslie Coltish, who performed the majority of the weighing and measuring; to Don Bailey, FSB, who arranged for the cooperation of the Head Recovery Lab in reading CWTs, and to F.C. Withler for providing liasion with Quinsam hatchery personnel as well as participating in field work.
